Amendments to the Claims:

- 1. (Currently Amended) A packet switched network architecture comprising a location area connected by a 2G radio access network to a 2G core networks and a 3G core network, in which the 2G radio access network switches packet transmissions from each terminal in the location area to one of the at least two core networks dependent on the terminal's capabilities, such that the 2G radio access network connects to the 2G core network terminals that are of a type not capable of connection to a 3G radio access network, and connects to the 3G core network terminals that are of a type capable of connection to a 3G radio access network.
- 2. (Currently Amended) The packet switched network architecture of claim 1 in which the radio access network switches packet transmissions from each terminal to one of the at least two core networks in dependence on the terminal type.
- 3. (Currently Amended) The packet switched network architecture of claim 1 in which the radio access network switches packet transmissions from each terminal to one of the at least two core networks in dependence on the identity of the cell in which the terminal is connected.
- 4. (Currently Amended) A method of switching packet transmissions in a packet switched network from each terminal in a location area connected by a 2G radio access network to a 2G core network and a 3G core network, in which the radio access network switching packet transmissions from each terminal to one of the at least two core networks dependent on the terminal's capabilities, such that the 2G radio access network connects to the 2G core network terminals that are of a type not capable of connection to a 3G radio access network, and connects to the 3G core network terminals that are of a type capable of connection to a 3G radio access network.
